Portfolio: cyber-portfolio-backend.onrender.com/index.html
GitHub: github.com/rjespinozaro-cloud

CERTIFICATIONS

Cisco Junior Cybersecurity Analyst
Full Path (Completed)
Cybersecurity Specialization
Netzun

TECHNICAL SKILLS

Hardening & Firewalls
UFW, nftables, arptables — deny-by-default policy
Traffic Analysis
Wireshark, tcpdump, tshark — layer 3/4/7 filtering
Networking & Segmentation
VLANs (802.1Q), subnetting (ipcalc), DNSSEC, ARP
Penetration Testing
Nmap, Metasploit, Burp Suite
Operating Systems
BlackArch, Parrot OS, Kali Linux, Windows
SIEM & Monitoring
Custom SIEM dashboard, active practice on LetsDefend
Backend Development
Spring Boot, MariaDB, JWT/BCrypt, JavaScript

LANGUAGES

Spanish	Native
English	B1

AVAILABILITY

Night shift available
Remote — international positions

Professional Summary

Undergraduate Systems Engineering student (7th semester) with hands-on defensive security experience: network infrastructure hardening, traffic analysis, and SIEM alert triage. Trained through the full Cisco Junior Cybersecurity Analyst path, with active, self-directed practice on Linux environments (BlackArch, Parrot OS) applying firewalls, network segmentation, and forensic log analysis. Complements this profile with backend development experience (Spring Boot, JWT), giving him insight into both network attack/defense and the code of the applications he protects. Fully available for night shift and remote positions.

Practical Experience & Labs

Network Infrastructure Hardening — Self-Directed Practice

BlackArch Linux / Parrot OS – Personal lab environment

- Configured firewalls with a **deny-by-default** policy (UFW/nftables), including SSH brute-force mitigation via rate-limiting and "invisible mode" against ICMP scanning (DROP vs. REJECT).
- Audited network layers (2, 3, 4, and 7) using native command-line tools:
 - **ip/ss** for interface and socket inspection,
 - **tcpdump/tshark** for traffic capture and filtering (SYN scan detection, exposure of unencrypted HTTP traffic).
- Verified DNS integrity via **DNSSEC** (dig) and designed network segmentation using VLANs (802.1Q) and subnet calculation (ipcalc) under the blast-radius reduction principle.

UFW nftables tcpdump tshark Wireshark DNSSEC VLAN/802.1Q

SOC Alert Triage — LetsDefend (Ongoing Practice)

Real-world SOC environment simulation

- Analyzed and classified High/Medium/Low severity alerts: web attacks (SQLi, XSS), malware (malicious macros), brute force, and phishing attempts.
- Decomposed multi-stage payloads (e.g., SQL Injection chained with an RCE attempt via system procedures), documenting IOCs, verdict (TP/FP), and containment recommendations.
- Managed cases end-to-end: artifact creation (IPs, URLs), planned-vs-unplanned traffic verification, and structured incident escalation.

Cyber Portfolio with Integrated SIEM System

Personal full-stack project

- Developed and deployed a security dashboard with request monitoring and real-time alert visualization (live SIEM log stream).
- Implemented secure authentication (JWT + BCrypt) and a logging system to detect and analyze web threats.
- Integrated a conversational AI assistant as a technical auditor for the portfolio itself.

Spring Boot MariaDB JavaScript JWT/BCrypt
