CERTIFICATIONS

Cisco Junior Cybersecurity Analyst
Full Path — Completed
Cybersecurity Specialization
Netzun

TECHNICAL SKILLS

Hardening & Firewalls
UFW, nftables, arptables — deny-by-default policy, Zero Trust

Traffic Analysis
Wireshark, tcpdump, tshark — L3/L4/L7 filtering, SYN scan detection

Networking & Segmentation
VLANs (802.1Q), subnetting (ipcalc), DNSSEC, L3 routing

Layer 2 Security (ARP)
Static ARP, arpwatch, arping, ARP Spoofing mitigation

Packet Scripting
Scapy — low-level packet crafting and analysis

Penetration Testing
Nmap, Metasploit, Burp Suite

Operating Systems
BlackArch, Parrot OS, Kali Linux, Windows — hands-on experience running multiple distros as primary OS

SIEM & Monitoring
Custom SIEM dashboard, active practice on LetsDefend and TryHackMe

Backend Development
Spring Boot, MariaDB, JWT/BCrypt, JavaScript

LANGUAGES

Spanish
Native

English
B1

AVAILABILITY

Night shift available
Remote — international positions

Ronaldiño Joanlu Espinoza Rosario

JUNIOR CYBERSECURITY ANALYST • SOC ANALYST TIER 1 / L1

PROFESSIONAL SUMMARY

Undergraduate Systems Engineering student (8th semester) targeting SOC Analyst Tier 1 / L1 roles, with hands-on defensive security experience: network infrastructure hardening, traffic analysis, security monitoring, and SIEM alert triage (incident response, IOC, TP/FP). Trained through the full Cisco Junior Cybersecurity Analyst path, with active, self-directed practice on Linux environments (BlackArch, Parrot OS) applying firewalls, network segmentation, and forensic log analysis. Complements this profile with backend development experience (Spring Boot, JWT), giving him insight into both network attack/defense and the code of the applications he protects. Fully available for night shift and remote positions.

PRACTICAL EXPERIENCE & LABS

Network Infrastructure Hardening — Self-Directed Practice *BlackArch / Parrot OS*
Personal lab environment.

- Configured firewalls with a deny-by-default policy (UFW/nftables), including SSH brute-force mitigation via rate-limiting and "invisible mode" against ICMP scanning (DROP vs. REJECT).
- Audited network layers (2, 3, 4, and 7) using native command-line tools: ip/ss for interface and socket inspection; tcpdump/tshark for traffic capture and filtering (SYN scan detection, exposure of unencrypted HTTP traffic).
- Verified DNS integrity via DNSSEC (dig) and designed network segmentation using VLANs (802.1Q) and subnet calculation (ipcalc) under the blast-radius reduction principle.

UFW • nftables • tcpdump • tshark • Wireshark • DNSSEC • VLAN/802.1Q

Active Layer 2/3 Defense & Zero Trust Approach *BlackArch / Parrot OS*

- Zero Trust approach (deny-by-default): UFW deny-incoming/allow-outgoing policy, SSH rate-limiting, and ICMP invisible mode, replicated on Debian/apt and Arch/pacman.
- Mitigated ARP Spoofing with static ARP entries (ip neighbor permanent), diagnostics via arping/ip neigh, and passive IP ↔ MAC monitoring with arpwatch.
- Crafted and analyzed ARP packets at a low level with Scapy to understand the anatomy of a spoofing attack without executing it.
- Route diagnostics and rogue-device detection using ip route, tracepath, and ping/ICMP.
- Detected SYN scans (Nmap -sS) via TCP flag filters in tcpdump, and performed forensic inspection of plaintext HTTP traffic with tshark.

Zero Trust • ARP Hardening • Scapy • tracepath • arpwatch

SOC Alert Triage — LetsDefend & TryHackMe *Ongoing Practice*
Real-world SOC environment simulation (SIEM, log analysis, Blue Team rooms).

- Analyzed and classified High/Medium/Low severity alerts: web attacks (SQLi, XSS), malware (malicious macros), brute force, and phishing attempts.
- Decomposed multi-stage payloads (e.g., SQL Injection chained with an RCE attempt via system procedures), documenting IOCs, verdict (TP/FP), and containment recommendations.
- Managed cases end-to-end: artifact creation (IPs, URLs), planned-vs-unplanned traffic verification, and structured incident escalation.

Cyber Portfolio with Integrated SIEM System *Personal Full-Stack Project*

- Developed and deployed a security dashboard with request monitoring and real-time alert visualization (live SIEM log stream).
- Implemented secure authentication (JWT + BCrypt) and a logging system to detect and analyze web threats.
- Integrated a conversational AI assistant as a technical auditor for the portfolio itself.

Spring Boot • MariaDB • JavaScript • JWT/BCrypt

EDUCATION

Systems Engineering *2026*
Universidad Nacional de San Martín (UNSM) — Tarapoto, Peru | 8th Semester
